

1                   **Abstract of the Disclosure**

2                 A rotation shaft support structure of a motor includes a shaft tube  
3                 having an inner wall provided with at least one bearing. A seal member made  
4                 of metallic material is securely combined on one end of the shaft tube. A  
5                 support member made of a wear resistant non-metallic material is supported by  
6                 the seal member. The support member has a resting portion, and one end of the  
7                 rotation shaft may be rested on the resting portion to rotate in the bearing.
